

ESCALATOR[®] **Fine Screen**

*A fine screen with aperture size of
¼ inch (6mm) or less in any direction.*

JOHN MEUNIER INC.

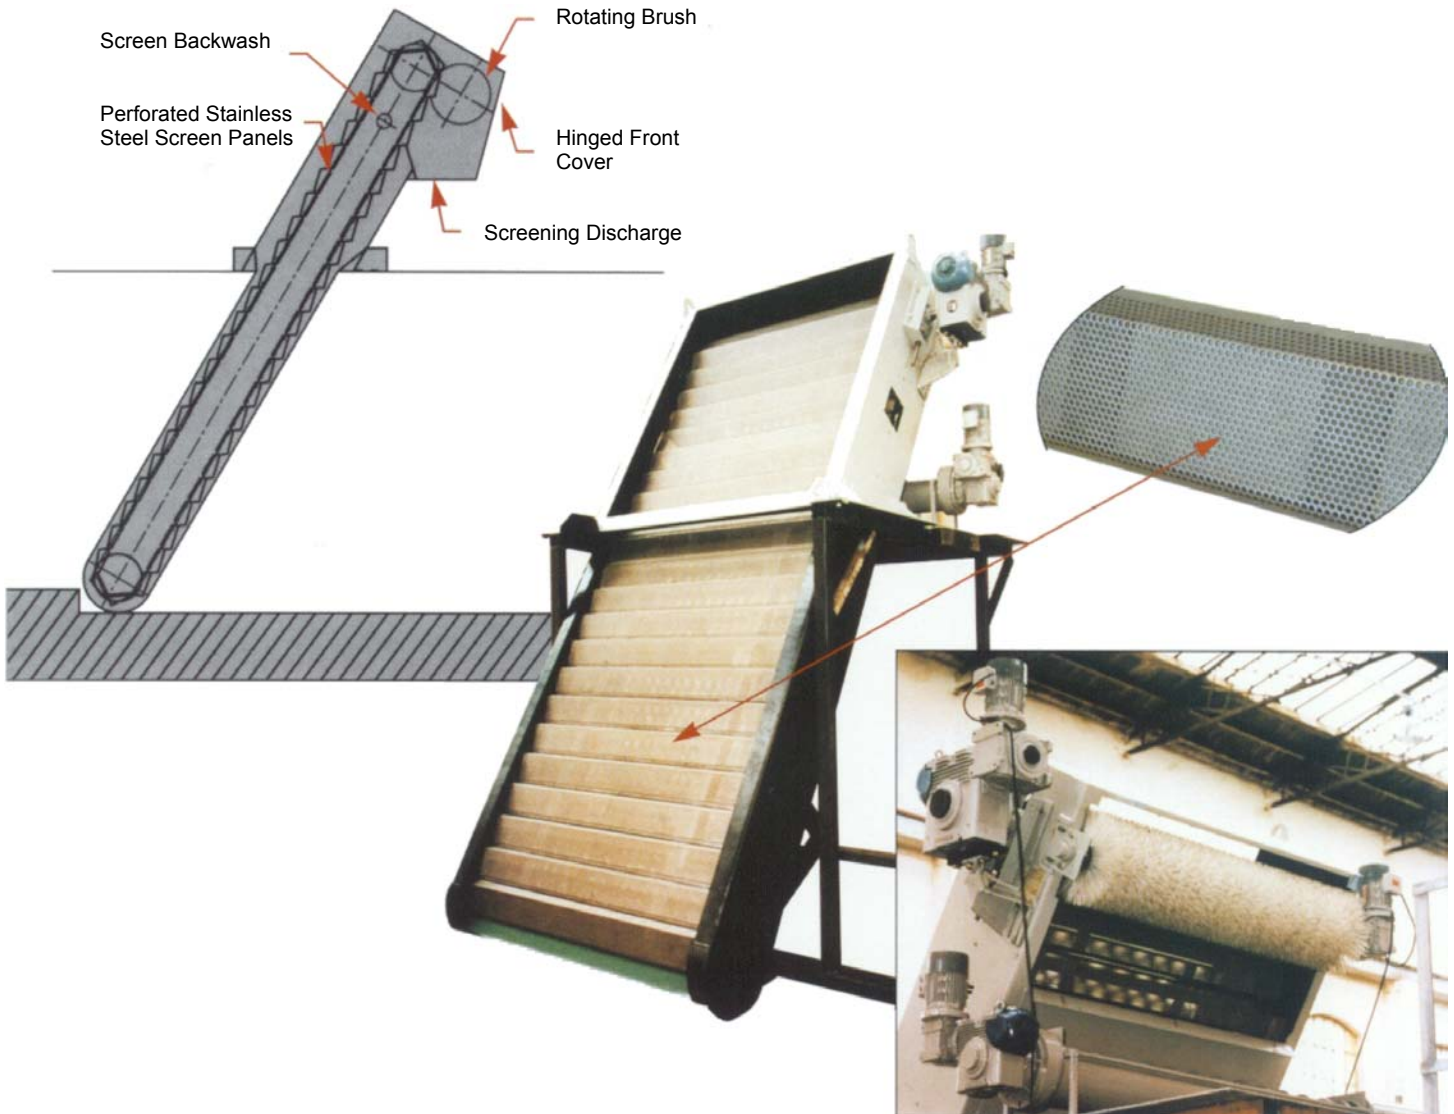

ESCALATOR®

The Escalator® gives continuous fine screening for channel type applications with very few moving parts below water level.

Perforated stainless steel screen panels are carried on heavy-duty chains and incorporate holes of ¼ inch (6mm) diameter or less giving fine screening in any direction. The screen panels are specially formed to create steps giving the ability to remove larger screenings and to increase the effective screening area.

Flow capacity is dependent on channel width, top water level and perforation size.

The Escalator® can readily be installed in new or existing channels with a minimum of civil alterations.
